LIST OF CURRENT CLAIMS

1. (Previously Presented) A method for testing the authenticity of a data carrier

having an integrated circuit by an external device with which the data carrier exchanges

data, comprising the steps of:

providing a first bidirectional transmission channel for transmitting signals having

signal patterns between the data carrier and the external device,

providing a second bidirectional transmission channel logically separated from the

first bidirectional transmission channel, the separation of the first and second bidirectional

transmission channels being so designed that data transmission via one bidirectional

transmission channel does not interfere with data transmission via the other bidirectional

transmission channel and the second bidirectional transmission channel is activable during

the total time period between activation and deactivation of the data carrier,

having the data carrier generate a signal required for authenticity testing,

transmitting the signal for authenticity testing from the data carrier to the external

device or a signal required for generating the signal for authenticity testing from the

external device to the data carrier at least partly via the second bidirectional transmission

channel, and

having the external device receive the signal for authenticity testing, and deciding

on the basis of the received signal whether the data carrier is authentic.

2. (Previously Presented) A method according to claim 1, characterized in that the

second bidirectional transmission channel is provided by modulating the signal of the first

bidirectional transmission channel.

Examiner: P. Pich

Art Unit: 2135

3. (Previously Presented) A method according to claim 2, characterized in that

modulation does not impair an ISO compatibility of data exchange between the data

carrier and the external device existing for the first bidirectional transmission channel.

4. (Currently Amended) A method according to claim 2, characterized in that

modulation is performed in areas of the signal pattern which are not evaluated according

to the ISO standard ISO 7816.

5. (Currently Amended) A method according to claim 2, characterized in that the

changes caused by modulation in the signal of the first bidirectional transmission channel

are within the range of variation of the signal level permitted by the ISO standard ISO

7816.

6. (Previously Presented) A method according to claim 2, characterized in that

modulation and demodulation of the signal are performed in the data carrier and in the

external device with the aid of a mixing/demixing device in each case.

7. (Previously Presented) A method according to claim 1, characterized in that

the first bidirectional transmission channel is a line for transmitting standard data or a line

for transmitting a clock signal or a line for supply voltage.

8. (Previously Presented) A method for testing the authenticity of a data carrier

having an integrated circuit by an external device with which the data carrier exchanges

data, comprising the steps of:

providing a first bidirectional transmission channel for transmitting signals

between the data carrier and the external device,

Examiner: P. Pich

Art Unit: 2135

providing a second bidirectional transmission channel physically separated from

the first bidirectional transmission channel and comprising at least one line or contactless

transmission path not provided according to the ISO standard, the second bidirectional

transmission channel being activable during the total time period between activation and

deactivation of the data carrier.

having the data carrier generate a signal required for authenticity testing,

transmitting the signal for authenticity testing from the data carrier to the external

device or a signal required for generating said signal for authenticity testing from the

external device to the data carrier at least partly via the second bidirectional transmission

channel, and

having the external device receive the signal for authenticity testing, and deciding

on the basis of the received signal whether the data carrier is authentic.

9. (Previously Presented) A method according to claim 8, characterized in that

the contactless transmission path is realized by transmitting the data as electromagnetic,

electrostatic, magnetic, acoustic or optical signals.

10. (Previously Presented) A method according to claim 9, characterized in that

a mixture of wavelengths is used for transmission via the contactless transmission path.

11. (Previously Presented) A method according to claim 1, characterized in that

the decision on authenticity of the data carrier is contingent on whether data exchange is

possible between the devices to which the first and second bidirectional transmission

channels are coupled in the data carrier.

Examiner: P. Pich

Art Unit: 2135

12. (Currently Amended) A data carrier which can exchange data with an

external device and as has an integrated circuit, wherein

the data carrier has a first device for generating signals for data exchange between

the data carrier and the external device, and the first device is adapted to be coupled to a

first bidirectional transmission channel,

the data carrier has a second device for generating signals required for authenticity

testing of the data carrier, and the second device is adapted to be coupled to a second

bidirectional transmission channel and connected with the first device,

the first and second bidirectional transmission channels are separated logically or

physically, and

data exchange with the second device does not interfere with data exchange with

the first device, and the second device is ready for generating signals for authenticity

testing of the data carrier during the total time period between activation and deactivation

of the data carrier.

13. (Previously Presented) A data carrier according to claim 12, characterized in

that the first device and the second device are each coupled to the bidirectional

transmission channels via a mixing/demixing module.

14. (Previously Presented) A system for testing the authenticity of a data carrier

and/or an external device comprising:

a data carrier with a first device for generating signals for data exchange with the

external device and a second device for generating and/or processing signals for

authenticity testing,

an external device with a first device for generating signals for data exchange with

the data carrier and a second device for generating and/or processing signals for

authenticity testing,

Examiner: P. Pich

Art Unit: 2135

a first bidirectional transmission channel for transmitting signals between the first device of the data carrier and the first device of the external device,

and a second bidirectional transmission channel for transmitting signals between the second device of the data carrier and the second device of the external device, the first and second bidirectional transmission channels being separated logically or physically and the separation of the first and second bidirectional transmission channels being so designed that data transmission via one bidirectional transmission channel does not interfere with data transmission via the other bidirectional transmission channel, and the second bidirectional transmission channel being activable during the total time period between activation and deactivation of the data carrier.
